

ABSTRACT

[0045]

A system and method is provided for providing, maintaining and accessing recording announcements in a telecommunications system. In the preferred embodiment, the system comprises at least one central office coupled to a telecommunication network. An announcement service node comprising a data schema and an application for accessing the data schema is coupled to the telecommunications network. The announcement service node is accessible by one or more central offices coupled to the telecommunications network. A storage mass is coupled to the announcement service node for storing recorded announcements.
